                                                                                                                                                                        ô
                                                                                                                                 Caps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAQ86425 encodes AAR71692 mating factor alpha 1-Insulin precursor Argal. Argals comperises the and A chains of a claimed human insulin derivative. In the final claimed compso. they are covalently connected via disulphide bonds between Cys residues A7/B7 and
host cells with pBAST-R results in the efficient expression of the projustin hybrid polypeptide, useful for human insulis production. The method produces recombinant human insulin identical to the natural hormone. Hazardous and cumbersone procedures involving cyanogen bromide and sulphitolysis to protect SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the leader attached and Cys ...protected.

His method produces pro-insulin and correctly bonded cys bridges. Compared with known methods it involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields. Sequences of insulin chain A, B and C are given in AAR68895-97. Sequences of pro-insulin 14 are given in AAR68898-901.

In formula (II), X = Lys, Arg or a peptide of 2-13 amino acids contq. Lys or Arg at the N- and C-termini: Y = a natural amino acid: R1 - Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid: R1 - Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid: R1 - Arg, Arg or Lys at the N- and C-termini: Y = a natural amino acids contq. Arg or Lys at the N- and C-termini: A3 = a natural amino acid: (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences from human or other insulin. The proinsulin molecule (produced in recombinant E.coli) is reacted with mercaptan at a ratio of 2-10 SH reasidues of mercaptan per Cys residue of proinsulin. The reaction takes place in the presence of a chaotropic auxiliary agent at pH 10-11 and results in proinsulin with correctly linked cystine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fro insulin is produced 'v treating recombinant precursor protein with a mercaptan to pro. .e 2-10 SH residues per Cys residue, in presence of a chaotropic agent and in ag. medium of pH 10-11, creating the prod. with 3-50 g hydrophobic adsorber resin per 1 ag. medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods it involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields.

Sequences of insulin chain A, B and C are given in AAR68895-97.

Sequences of pro-insulin 14 are given in AAR68898-901.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence is that of a fusion protein, produced in E.coli which contains an example of a proinsulin molecule corresp.

C thing general formula R2-R1-(82-829)-Y-X-G1y-(A2-A20)-R3 (II). In formula (II), X = Iys, Arg or a peptide of 2-35 amino acids contg.

Lys or Arg at the N- and C-termini; Y = a natural amino acids; R1 = C phe or a bond; R2 = H, Arg, Lys, a peptide of 2-35 amino acids contg.

C phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acids

C ortor. Arg or Lys at the N- and C-termini; R3 = a natural amino acids

C ortor, Arg or Lys at the N- and C-termini; R3 = a natural amino

acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences

C from human or other insulin. The proinsulin molecule, released by

cyanogen bromide, is reacted with mercaptan at a ratio of 2-10 SH

residues of mercaptan per Cys residue of proinsulin. The reaction

C takes place in the presence of a chaotropic auxiliary agent at

pH 10-11 and results in proinsulin with correctly linked cystine

C bridges. Reaction with trypsin and opt. carboxypeptidase B yields

Correctly folded insulin. The insulin is isolated by absortion on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolation of insulin that is correctly post-translationally processed - by reacting pro:insulin with a mercaptan in the presence of a chaotropic agent and purificn. after absorption to hydrophobic

The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the N-terminal amino acids EEAEAEAR. In the final claimed compsorthey are covalently connected via disulphide bonds between Cys residues A7/B7 and A20/B19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAQ86432 encodes AAR71695 mating factor alpha 1-Insulin precursor Arghl, Argala N-terminal EEAEARAER. The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the N-terminal amino acids EEAEAEAER. In the final claimed compsn. they are covalently connected via disulphide bonds between Cys residues A7/P3 and A20/B19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

And B chains. This insulin precursor is a component of the chineric proteins insulin precursor is a component of the chineric proteins high-mini-proinsulin (AAY42860) and the chimeric protein agreement of human growth hormone (hdh) and a cleavable optide linker (AAY42857). The hdH portion of the chimeric protein acts as an intranolecular chaperone (IMC) for the insulin precursor.

The chimeric protein chaperone (IMC) for the postide linker has a criemal and residue which enables the hdH portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin with correctly linked cysteine bridges with provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield from intracellular degradation by a microordanism host intracellular degradation breewest the intermolecular interactions among the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fused insulin precursor. The procedural steps of cyanogen bromide cleavage, oxidative sulphitotysis and related cyanogen bromide cleavage, oxidative sulphitotysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a human insulin precursor comprising insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New chimeric proteins containing human growth hormone fragment, used particularly for the production of human insulin \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

This fusion protein may be converted into human insulin using known methods. The synthetic gene was prepared by the phosphoramidite method. See also AAQ04336.

Human recombinant insulin may be expressed in Saccharomyces cerevisiae following linkage of the gene to the glycosylphospatidylinositol anchor. This anchoring technique can provide for the release of the product in a highly specific and solective manner. In addition, the recombinant protein will contain an epitope which can be used in its final purification by immunoaffinity. The protein product can be released by e.g. nifrous deamination or treatment with neutral detergent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Sequence 18, Application US/09894711
Patent No. US20020137144A1
GNERAL INFORMATION:
GNERAL INFORMATION:
GNERAL INFORMATION:
GNERAL TO. US20020137144A1
APPLICANT:
Ludvigsen, Svend
TITLE OF INVENTION:
INSULID precursors and
TITLE OF INVENTION:
INSULID precursor analogues having improved fermentation
FILE FERRENCE: 6144.400-02
CURRENT APPLICATION NUMBER: US/09/894,711
CURRENT FILING DATE: 2001-06.28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                56 FVNQHLCGSHLVEALYLVCGERGFFYTPKTRGIVEQCCTSICSLYQLENYCN 107

TITLE OF INVENTION: Improved process for obtaining
insulin precursors having correctly bonded cystine bridges
                                                                                                                                                                                              Sequence 63, Application US/09280030A

Sequence 63, Application US/09280030A

Patent No. US2001002151Sal

GENERAL INFORMATION:

APPLICANT: Sato, Seiji

APPLICANT: Hogashikuni, Naohiko

APPLICANT: Kondo, Masaaki

TITLE OF INVENTION: DREF ENCODING NEW FUSION PROTEINS AND PROCESSES FOR

TITLE OF INVENTION: PREPARING USFFUL POLYPEPTIDES THROUGH EXPRESSION OF THE

TITLE OF INVENTION: DASS

CURRENT APPLICATION NUMBER: US/09/280.030A

CURRENT FILING DATE: 1999-03-26

CURRENT FILING DATE: 1999-03-31

NUMBER OF SEQ ID NOS: 66

SEQ ID NO 63

EARLIER PATENTING USECODING NOS: 66

SEQ ID NO 63

Fatent No. US20010041787A1

GENERAL INFORMATION:

APPLICANT: Kjeldsen, Thomas Borglum

APPLICANT: Lodvigsen, Svend

TITLE OF INVENTION: Method for making insulin precursors and

TITLE OF INVENTION: Method for making insulin precursor analogues having improved fermentation

TITLE OF INVENTION: yield in yeast

FILE REFERENCE: 6148.200-US

GENERAL INFORMATION
APPLICANT: Kjeldsen, Thomas Borglum
APPLICANT: Ludvigsen, Svend
TITLE OF INVENTION: Method for making insulin precursors and
TITLE OF INVENTION: Wield in yeast
TITLE OF INVENTION: yield in yeast
TITLE OF INVENTION: yield in yeast
TITLE OF INVENTION: yield in yeast

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"The nucleotide sequence of cDNA coding for preproinsulin from the primate Macaca fascicularis.":

179-183 (1982).

1- FUNCTION: INSULIN DECREASE BLOOD GLUCOSE CONCENTRATION. IT INCREASES CELL PERMEABILITY TO MONOSACCHARIDES. AMINO ACIDS AND FATTY ACIDS: IT ACCELERATES GLYCOLESIS, THE PENTOSE PHOSPHATE CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.

1- SUBUNIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO
            Macaca fascicularis (Crab eating macaque) (Cynomolgus monkey).

*Species variation in the amino acid sequence of insulin.":

**. J. Med. 40:66(1966).

-!- FUNCTION: INSULIN DECREASES BLOOD GLUCOSE CONCENTRATION. 11

INCREASES CELL PERMEABILITY TO MONOSACCHARIDES, AMINO ACIDS AND
FATTY ACIDS. IT ACCELERATES GLYCOLYSIS, THE PENTUSE PHOSPHATE
CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.

-!- SUBUNIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY IWO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Comparative sequence analysis of the INS-IGF2-H19 gene cluster in

I- FUNCTION: INSULIN DECREASES BLOOD GLUCOSE CONFURTRATION. IT
INCREASES CELL PERMEABILITY TO MONOSACCHARIDES, AMINO ACIDS AND
FATTY ACIDS. IT ACCELERATES GLYCOLYSIS, THE PENTOSE PHOSPHATE
CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.
IL SUBUNIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO
                                                                                                        Glucose metabolism; Signal; 3D-structure.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3
                                                                                                  of the chimeric protein acts as an intramplecular chaperone [IMC] for the insulin precursor, enabling it to fold correctly. The cleavable peptide linker has a C-terminal Arq residue which enables the hGH portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin via an hGH-profusulin chimeric protein can provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intracellular degradation by a microorganism host, but also promote the folding of the fused insulin precursor, facilitate the solution proteins and decrease the intermolecular interactions among the fusion proteins of this allowing folding of the fusion proteins. The fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphitolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                                                                                                         ö

This sequence represents a commercing protein. Instituting protein contains an N-terminal fragment of human growth hormone (h681) of the sequence given in AAV42855, a cleavable peptide linker (AAV42857), and a human insulin precursor comperising insulin A and B chains (AAV42857). The help portion of the chimeric protein acts as an intramolecular chapterone (IMC) for the insulin precursor, can be intramolecular chapterone (IMC) tor the insulin precursor.

C enabling it to fold correctly. The cleavable peptide linker has a c-terminal Arg residue which enables the h6H portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin via an h6H profusulin chimeric protein can provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of hmman insulin with has an encorporations among the foling of the fused insulin precursor, facilitate the solubility of the fusion protein and decreae e the intermolecular incremetions among the fusion proteins, thus all wing folding of the tused insulin precursor at commercially useful high concentrations, the tuse of high the use of high concentration steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 TPSNREETQQKSNLEHRISHLLIQSWLEPVQLGTGPRFVNQHLCGSHLVEALYLVCGER 120

                                                                                                                                                                          (hGH) which is a component of a chimeric protein (AAV42861) which are contains a human insulin precursor (AAV42859). The hGH portion of the chimeric protein acts as an intranolecular chapterone (IMC) for the insulin precursor, enabling it to fold correctly. A cleavable peptide linker with a C-terminal Arg residue (AAV42857) enables the hGH portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin via an hGH-proinsulin chimeric protein can provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intracellular degradation by a microorganism host, but also promote the folding of the fused insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular chaptering among the fusion protein and decrease the intermolecular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         interactions among the fusion proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphitolysis
                                                                                                                                                                sequence represents an N-terminal fragment of human growth hormone
                                                                                                                                                                                                                                                                                                                                                                                                                      and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic

requirings and recovering mail formation, arthritic such as rheumation arthritis, atherosclerotic plaques, corneal graft neovascularisation, delayed wound healing, proliberative retinopathy such as diabetic retinopathy, macular degeneration, granulations such as those occurring in haemophilic joints, inappropriate vascularisation in wound healing such as hypertrophic scars or keloid scars, neovascular glaucoma, ocular tumour, uveitis, non-union fractures, Osler-Weber syndrome, psoriasis, pyogenic glaucoma, retrolental fibroplasia, scheroderma, solid tumours, kaposi's sarcoma, trachoma, vascular adhesions, chronic varicose ulcers, leukaemia, and reproductive disorders such as follicular and luteal cysts and choriocarcinoma. They can also be used as contraceptive agents. DNA encoding the poptides can be used in gene therapy. The measurement of abnormal levels of N-terminal Iraqments of high, hGH-V, prolator to help.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel human anti-angiogenic peptides derived from 10 to 150 consecutive amine acids selected from the N-terminal end of human placental latteger. (***I**), human growth hormone (hGH), growth hormone bariant (hGH**V), or he an productin. Such peptides (i) inhibit capillary endothelial cell preciferation and organisation (ii) inhibit angiogenesis in chick chorioallantoic membrane and (iii) binds to at least one specific receptor which does not bind an intact full length hGH, hPL, prolactin or hGH**V. The invention also describes a method for diagnosing a probable abnormality of placental vascularisation during pregnancy. The peptides can e used for treating an angiogenic disease in modulating vascularisation of patient's placenta. In particular, the peptides can be used for preventing or treating e.g. malignant tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MFPT1PLSRLFDNAMLRAHRLHQLAFDTYQEFEEAY1PKEQKYSFLQNPQTSLSFSES1P 60
